

CHAPTER V

CONCLUSION

The findings of the study indicate that students do not sufficiently ready with the application of online learning. By the used of PEEK theory, Lickert scale and Sugiyono's theory, it found students only have 34% for online learning readiness. However in some aspects, students convey that they able to practice well in online learning and their teacher already gave them feedback and motivation for improving their productive skills.

Regarding the finding of this study, some recommendations are suggested. For lecturer, because online learning is the only way to teach in the middle of Covid-19 pandemic, teacher have to create the most accessible and fun materials for students. As we know that students are complaining about internet problem and the use of accessible materials is for equal learning for each student.
