ABSTRAK

Penelitian ini bertujuan untuk mengetahui hubungan antara *intimate friendship* dengan *self disclosure* pada gen z. Hipotesis yang diajukan yaitu ada hubungan positif antara *intimate friendship* dengan *self disclosure* pada gen z. Subjek penelitian ini berjumlah 270 orang gen z dengan rentang usia 14-29 tahun. Pengambilan subjek menggunakan teknik *sampling purposive* dengan data yang dikumpulkan menggunakan skala *intimate friendship* dan skala *self disclosure*. Data dianalisis menggunakan korelasi *product moment* dengan menggunakan SPSS versi 24. Berdasarkan hasil analisis, diperoleh nilai korelasi (rxy) = 0,730 dengan p = 0,000, sehingga hipotesis yang diajukan dalam penelitian diterima. Hal ini menunjukkan bahwa terdapat hubungan positif yang signifikan antara *intimate friendship dengan self disclosure* pada gen z. Dalam penelitian ini koefisien determinasi (R^2) diperoleh sebesar 0,532 hal tersebut menunjukkan bahwa variabel *intimate friendship* memiliki kontribusi sebesar 53,2% terhadap variabel *self disclosure* dan sisanya (46,8%) dipengaruhi oleh faktor-faktor lainnya yang tidak di teliti dalam penelitian ini.

Kata kunci: generasi z, *intimate friendship*, *self disclosure*

ABSTRACT

This research aims to determine the relationship between *intimate friendship* with *self disclosure* in Gen Z. The hypothesis proposed is that there is a positive relationship between *intimate friendship* with *self disclosure* in Gen Z. The subjects of this research were 270 Gen Z people with an age range of 14-29 years. Taking subjects using techniques *sampling purposive* with data collected using a scale *intimate friendship* and scale *self disclosure*. Data were analyzed using correlation *product moment* using SPSS version 24. Based on the results of the analysis, a correlation value (rxy) = 0.730 with p = 0.000 was obtained, so the hypothesis proposed in the research was accepted. This shows that there is a significant positive relationship between *intimate friendship* with *self disclosure* in Gen Z. In this study the coefficient of determination (R^2) obtained at 0.532, this shows that the variable *intimate friendship* has a contribution of 53.2% to the variable *self disclosure* and the remainder (46.8%) was influenced by other factors not examined in this study.

Keywords: *generation z*, *intimate friendship*, *self disclosure*
